

ABSTRACT OF THE DISCLOSURE

An applicator/dispenser assembly for dispensing and/or applying an adhesive material comprises: a first body portion and a second body portion, at least one of the first and second body portions being movable relative to the other of the first and second body portions; a cavity in at least one of the first and second body portions; and a piercing or breaking member arranged on one of the first and second body portions. Movement of one of the first and second body portions relative to the other of the first and second body portions moves the piercing or breaking member into the cavity. When a container of adhesive material is at least partially disposed within the cavity, movement of one of the first and second body portions relative to the other moves the piercing or breaking member to rupture the container for dispensing and/or applying the adhesive material.
